

Guideline HIRAC

This Guideline relates to OHS Procedure – Hazard Identification, Risk Assessment and Control (HIRAC)

1. Selection

The first step of the HIRAC review is to select an area, task or activity. Priority should be given to areas, tasks or activities thought to present special risks, based on:

- past experience (e.g. accidents, near-misses, complaints)
- concerns expressed by staff
- requirements of legislation or University policies and procedures (e.g. workplace changes)
- requests from the various Health and Safety Teams, etc.

2. Hazard Identification

Hazards can be grouped under various categories, as listed below. The items listed under each category are provided as examples.

Bio-mechanical and Postural

Note: where the main hazards associated with an activity or task relate to manual handling, a special HIRAC form should be used. It is available at: http://www.federation.edu.au/staff/working-at-feduni/risk,-health-and-safety/forms-and-templates

<u>sa</u>	<u>afety/forms-and-templates</u>		
	Repetitive or sustained postures, movements or f time, or for more than two hours over a workday Excessive bending or twisting of back or neck in any direction Working with hand(s) above shoulders Reaching to front/side more than 30cm from body Reaching behind body Squatting, kneeling, crawling, semi-lying or jumping Standing with most of body weight on one leg	orces as listed below for more than thirty minutes at Twisting, turning, grabbing, picking or wringing actions with fingers, hands or arms Working with fingers close together or wide apart Very fast movements Excessive bending of wrist(s) Carrying with one hand or one side of t body Pushing, pulling, dragging, holding or restraining	
	High force actions as listed below Lifting, lowering or carrying heavy loads Applying uneven, fast or jerky forces Sudden/unexpected forces Pushing/pulling objects hard to move or stop hysical Environment and Workplace Design		n,
	Poor housekeeping, uncontained spillages or was	cies	
	Uneven or slippery work surfaces Obstacles in passageways, near equipment, risk	of collision with stationary objects, etc.	
	Obstacles in passageways, near equipment, risk	oi combion with stationary objects, etc	

Warning – Uncontrolled when printed! The current version of this document is kept on the University website.

Mismatch between plant, workplace, office workstation design, activity or task and user physical

Inadequate work platforms, stairs, ladders, quardrails, harnesses, etc. for work at height

Personnel access within two metres of edge of roof, high place of work, etc

Unprotected openings or gaps in walkways and platforms

characteristics (height, strength, speed, mobility, fitness, etc)

Poor lighting

Exposure to harmful noise levels

Confusing or inadequate labelling of controls

Guideline

01/12/2021

31/12/2025

	Insufficient consideration given to consultation prior to workplace changes
Na	tural Environment
	Drowning
	Bushfires
	Persons becoming lost or ill in remote locations
	Possibility of being engulfed in loose or crumbling ground
	Exposure to extreme environmental conditions (hot, cold, dry, wet, snowy, stormy, etc)
	Possibility of tree limbs falling

☐ Mismatch between task demands and workers'/people's behaviour or capabilities

3. Risk Assessment

Lightning in exposed locations

Risk assessments are based on two key factors:

- the consequence of any injury/illness resulting from the hazard, and
- the <u>likelihood</u> that the injury/illness will actually occur.

		CONSEQUENCE				
		Insignificant	Minor	Moderate	Major	Severe
	Almost Certain	Medium	High	High	Extreme	Extreme
ООС	Likely	Medium	Medium	High	High	Extreme
LIKELIHOOD	Possible	Low	Medium	Medium	High	High
LIKE	Unlikely	Low	Medium	Medium	Medium	High
	Rare	Low	Low	Low	Medium	Medium

For further details and definitions on conducting a risk assessment, refer to the University's <u>Risk Assessment</u> <u>Guideline</u>.

4. Risk Control

Urgent action is required for risks assessed as Extreme. The actions required may include:

- instructions for the immediate end of the work, process, activity, etc
- isolation of the hazard until more permanent measures can be implemented.

Actions taken to address an Extreme risk must be documented on a Hazard/Near-Miss Report form.

Documented control plans with responsibilities and completion dates are required for High and Medium risks. (Refer to HIRAC Report available at: http://www.federation.edu.au/staff/working-at-feduni/risk,-health-and-safety/forms-and-templates)

The risk control hierarchy ranks risk control measures in decreasing order of effectiveness. Risk control measures should always aim as high in the list as practicable. Control of any given risk generally involves several measures drawn from the various options (except if the hazard is eliminated).

Warning – Uncontrolled when printed! The current version of this document is kept on the University website.

Current Version:
Review Date:

Guideline **HIRAC**

Risk Control Hierarchy:

- Elimination of hazard: examples include the proper disposal of redundant items of equipment that A. contain substances such as asbestos or PCBs, the removal of excess quantities of chemical accumulated over time in a laboratory, etc. The elimination of hazards is 100% effective.
- B. Substitution of hazard: examples include the replacement of solvent-based printing inks with waterbased ones, of asbestos insulation or fire-proofing with synthetic fibres or rockwool, the use of titanium dioxide white pigment instead of lead white, etc. The effectiveness of substitution is wholly dependent on the choice of replacement.
- C. Engineering controls: examples include the installation of machine guards on hazardous equipment. the provision of local exhaust ventilation over a process area releasing noxious fumes, fitting a muffler on a noisy exhaust pipe, etc.
- Administrative controls: include training and education, job rotation to share the load created by D. demanding tasks, planning, scheduling certain jobs outside normal working hours to reduce general exposure (e.g. planning demolition and building works during summer recess), early reporting of signs and symptoms, instructions and warnings, etc. Administrative control measures typically require significant resources to be maintained over long periods of time for continuing levels of effectiveness.
- E. Personal protective equipment (PPE): includes safety glasses and goggles, earmuffs and earplugs, hard hats, toe-capped footwear, gloves, respiratory protection, aprons, etc. Research has shown that the effectiveness of personal protective equipment in realistic work situations is quite low. PPE is therefore best seen as a "last line of defence" against hazards to be used in conjunction with other risk control measures.

Warning - Uncontrolled when printed! The current version of this document is kept on the University website.
